Last updated on March 31, 2021 – v0.2

1. Introduction

The PIN tracer is a remote debugger plugin used to record execution traces. It allows to record traces on Linux and Windows (x86 and x86_64) from any of the supported IDA platforms (Windows, Linux and MacOSX). Support for MacOSX targets is not yet available.

1.1. PIN support for MacOSX

Recording traces on MacOSX target is not supported yet.

However, it's possible to record traces from a Linux or Windows target using the MacOSX version of IDA.

2. Building the PIN tool

Before using the PIN tracer the PIN tool module (distributed only in source code form) must be built as the Intel PIN license disallows redistributing PIN tools in binary form.

First of all download PIN from <http://www.pintool.org> , and unpack it on your hard drive.

IMPORTANT the PIN tools are a little sensitive to spaces in paths. Therefore, we recommend unpacking in a no-space path. E.g., "`C:\pin`", but not "`C:\Program Files (x86)\`".

The building process of the PIN tool is different for Windows and Linux.

2.1. Building on Windows

1. Install Visual Studio. It is possible to build the PIN tool with the Express version of Visual Studio for C++.
2. Download the IDA pintool sources from:
[https://www.hex-rays.com/products/ida/support/freefiles/idapin\\$\(IDAMAJMIN\).zip](https://www.hex-rays.com/products/ida/support/freefiles/idapin$(IDAMAJMIN).zip) (*)

pintool 6.9 and higher should be built with PIN version 3.0 and higher, for earlier versions of pintool you should use PIN build 65163.
3. Unpack the .zip file into `/path/to/pin/source/tools/`
4. Open `/path/to/pin/source/tools/idapin/IDADBG.sln` in Visual Studio, select the correct build configuration (either Win32 or x64) and build the solution.

Alternatively you can use GNU make:

1. Install GNU make as a part of cygwin or MinGW package

2. Unpack the .zip file into /path/to/pin/source/tools/
3. Prepare Visual Studio environment (e.g. %VCINSTALLDIR%\Auxiliary\Build\vcvars32.bat for 32-bit pintool or %VCINSTALLDIR%\Auxiliary\Build\vcvars64.bat for 64-bit one)
4. cd /path/to/pin/source/tools/idapin
5. make

2.2. Building on Linux

1. Install GCC 3.4 or later
2. Download the IDA pintool sources from:
[https://www.hex-rays.com/products/ida/support/frefiles/idapin\\$\(IDAMAJMIN\).zip](https://www.hex-rays.com/products/ida/support/frefiles/idapin$(IDAMAJMIN).zip) (*)
3. Unpack the .zip file into /path/to/pin/source/tools/
4. Open a console, and do the following (only for versions of PIN prior to 3.0):
 - a. cd /path/to/pin/ia32/runtime
 - b. ln -s libelf.so.0.8.13 libelf.so
 - c. cd /path/to/pin/intel64/runtime
 - d. ln -s libelf.so.0.8.13 libelf.so
 - e. cd /path/to/pin/source/tools/Utils
 - f. ls testGccVersion 2>/dev/null || ln -s ../testGccVersion testGccVersion
5. cd /path/to/pin/source/tools/idapin

```
$ make TARGET=ia32
```

for building the x86 version, or

```
$ make TARGET=intel64
```

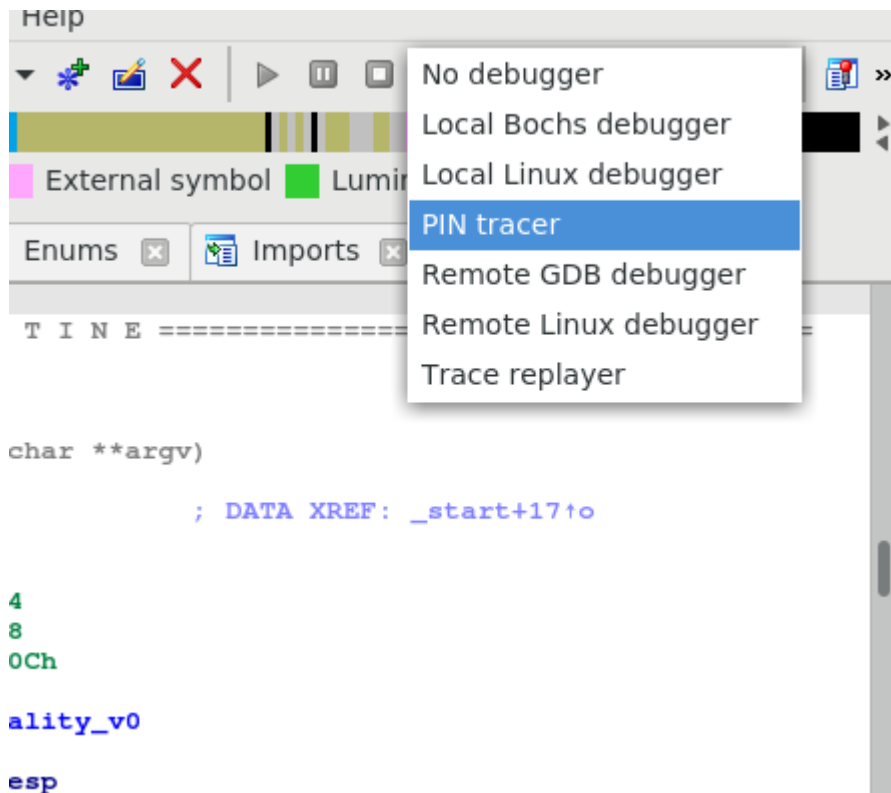

for the x64 version.

(*) Where '\$(IDAMAJMIN)' is the IDA version major/minor. E.g., for IDA 7.6, the final URL would be: <https://www.hex-rays.com/products/ida/support/frefiles/idapin76.zip>

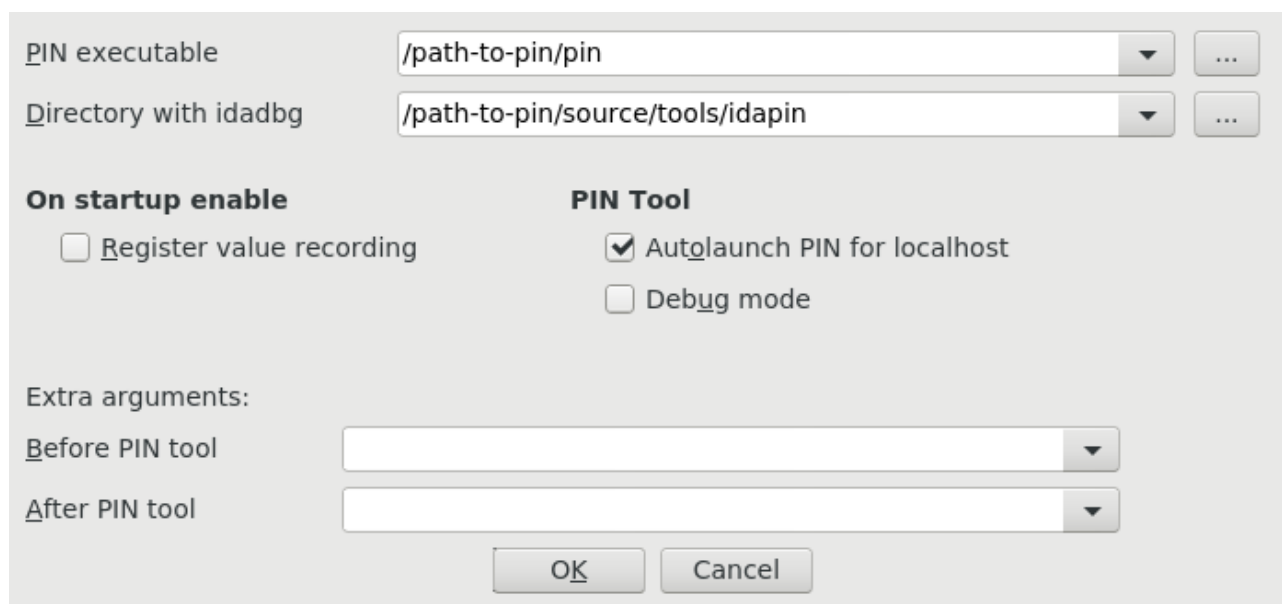

Pintool 6.9 and higher are compatible with versions 6.5-6.8 of IDA so currently you can use them.

3. Start process

Once the PIN tool module is built we can use it in IDA. Open a binary in IDA and wait for the initial analysis to finish. When it's done select the PIN tracer module from the debuggers drop down list or via **Debugger > Select debugger**:

After selecting the PIN tracer module select the menu **Debugger > Debugger options > Set specific options**. The following new dialog will be displayed:

In this dialog at least the following options are mandatory:

1. **PIN executable:** This is the full path to the PIN binary (including the "pin.exe" or "pin" file name). In some versions "pin.sh" may exist – in this case you should use it.
2. **Directory with idadbg:** This is the directory where the *idadbg.so* or *idadbg.dll* PIN tool resides. Please note that **only the directory must be specified**.

Fill the form with the correct paths and press OK in this dialog and enable option **Autolaunch PIN for localhost**.

We can interact with the PIN tracer like with any other debugger module: add breakpoints and step into or step over functions by pressing F7 or F8 alternatively.

Now we put a breakpoint in the very first instruction of function **main**

```

.text:08048492
.text:08048492 char_in_main= byte ptr -5
.text:08048492 foo= dword ptr -4
.text:08048492 argc= dword ptr 8
.text:08048492 argv= dword ptr 0Ch
.text:08048492 ; __unwind { // __gxx_personality_v0
.text:08048492 push ebp
.text:08048493 mov ebp, esp
.text:08048495 sub esp, 18h
.text:08048498 mov [ebp+char_in_main], 62h ; 'b'
.text:0804849C lea eax, [ebp+char_in_main]
.text:0804849F mov [esp+4], eax ; in_char_ptr
.text:080484A3 mov dword ptr [esp], 7Ah ; 'z' ; in_char
.text:080484AA call _Z10return_intcPc ; return_int(char, char *)
.text:080484AF mov [ebp+foo], eax
.text:080484B2 mov eax, [ebp+foo]
.text:080484B5 leave
.text:080484B6 retn
.text:080484B6 ; } // starts at 8048492
00000492 08048492: main (Synchronized with EIP)

```

Make several steps by pressing F8. We can see all the instructions that were executed changed their color:

```

.text:08048492 argc= dword ptr 8
.text:08048492 argv= dword ptr 0Ch
.text:08048492
.text:08048492 ; __unwind { // __gxx_personality_v0
.text:08048492 push    ebp
.text:08048493 mov     ebp, esp
.text:08048495 sub     esp, 18h
.text:08048498 mov     [ebp+char_in_main], 62h ; 'b'
.text:0804849C lea    eax, [ebp+char_in_main]
.text:0804849F mov     [esp+4], eax           ; in_char_ptr
.text:080484A3 mov     dword ptr [esp], 7Ah ; 'z'           ; in_char
.text:080484AA call   _Z10return_intcPc           ; return_int(char, char *)
.text:080484AF mov     [ebp+foo], eax
.text:080484B2 mov     eax, [ebp+foo]
.text:080484B5 leave
.text:080484B6 retn
.text:080484B6 ; } // starts at 8048492
.text:080484B6 main endp
.text:080484B6
.text:080484B6 ; -----
.text:080484B7 align 10h
.text:080484C0
.text:080484C0 ; ===== S U B R O U T I N E =====
.text:080484C0
.text:080484C0 ; Attributes: bp-based frame
.text:080484C0
.text:080484C0 public __libc_csu_fini
.text:080484C0 __libc_csu_fini proc near           ; DATA XREF: _start+B*o
00000492 | 08048492: main | (Synchronized with EIP)

```

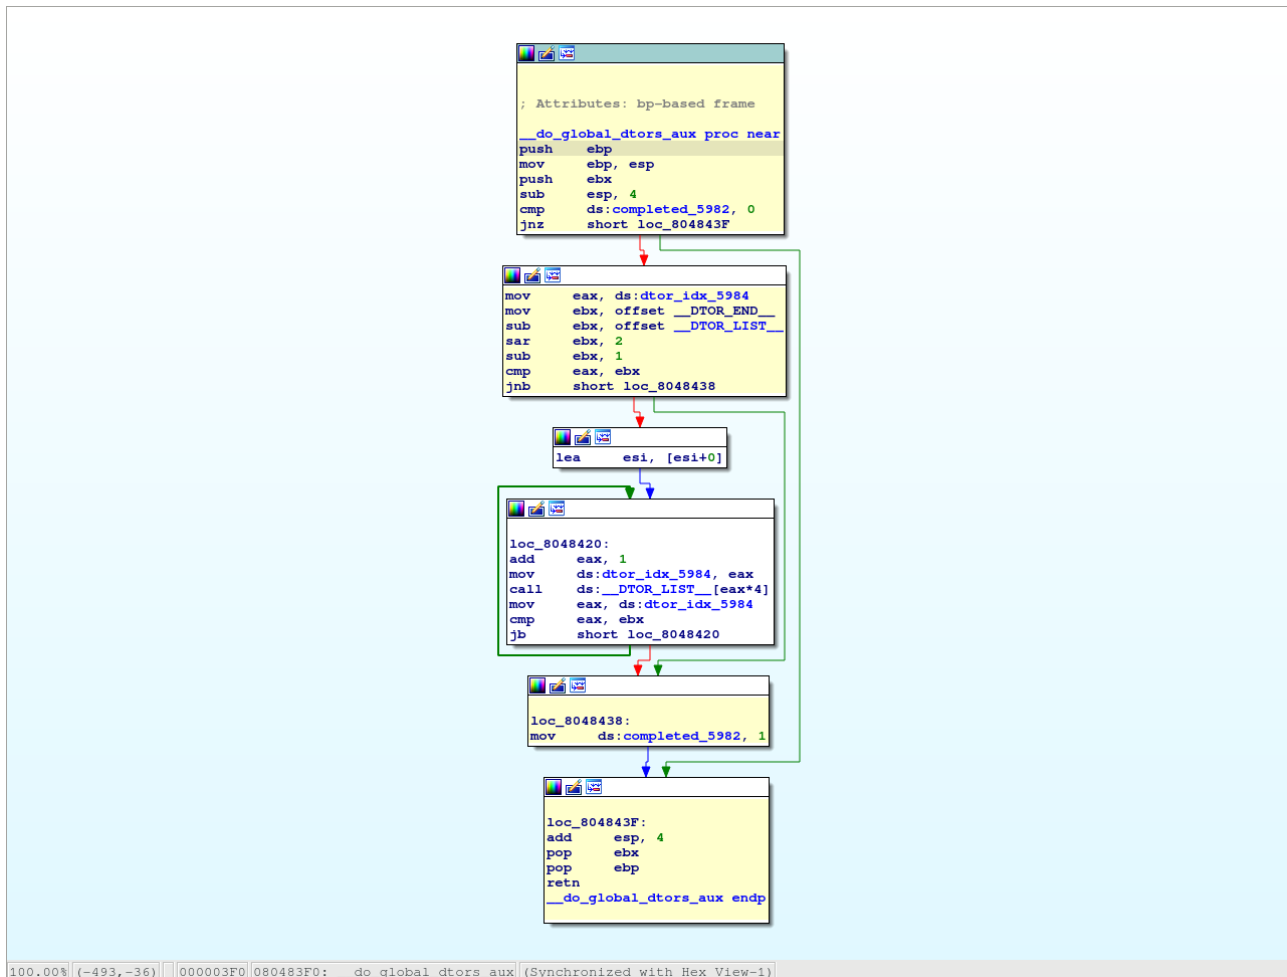

Now let the application run and finish by pressing F9 again. After a while the process will terminate and IDA will display a dialog telling us that is reading the recorded trace. Once IDA reads the trace the debugger will stop and the instructions executed will be highlighted (like with the built-in tracing engine) as in the following picture:

```

.text:080483F0
.text:080483F0 ; Attributes: bp-based frame
.text:080483F0
.text:080483F0 __do_global_dtors_aux proc near           ; CODE XREF: _term_proc+13+p
.text:080483F0 push    ebp
.text:080483F1 mov     ebp, esp
.text:080483F3 push    ebx
.text:080483F4 sub     esp, 4
.text:080483F7 cmp     ds:completed_5982, 0
.text:080483FE jnz    short loc_804843F
.text:08048400 mov     eax, ds:dtor_idx_5984
.text:08048405 mov     ebx, offset __DTOR_END__
.text:0804840A sub     ebx, offset __DTOR_LIST__
.text:08048410 sar     ebx, 2
.text:08048413 sub     ebx, 1
.text:08048416 cmp     eax, ebx
.text:08048418 jnb    short loc_8048438
.text:0804841A lea    esi, [esi+0]
.text:08048420 loc_8048420: add     eax, 1           ; CODE XREF: __do_global_dtors_aux+46+j
.text:08048420
000003F0 | 080483F0: __do_global_dtors_aux | (Synchronized with Hex View-1)

```

We can see in the graph view mode the complete path the application took in some specific function by switching to the graph view, pressing space bar and then pressing "w" to zoom out:

4. Attach to an existing process

Instead of launching a new process we could attach to a running process and debug it. For that we could have selected the "**Debugger > Attach to process...**" menu item. IDA will display a list of active processes.

ID	Name
10332	[64] /usr/bin/scl enable devtoolset-6 -- bash --init-file /home/pa...
10333	[64] /bin/bash /var/tmp/scl84SCEu

Line 1 of 185

We just select the process we want to attach to. IDA will then attach to the selected process, and leave it suspended at the place it was when it was attached to:

The screenshot displays the IDA Pro interface with the following components:

- IDA View-RIP:** Shows assembly code for a function in `libc.so.6`. The code includes instructions like `syscall`, `cmp`, `ja`, `retn`, `sub`, `mov`, `call`, `mov`, `r8d, eax`, and `syscall`. Comments include `; LINUX -` and `; CODE XREF: write+E+j`.
- General:** Shows register values: RAX 00000000, RBX 00000000, RCX 00000000, RDX 00000000, RSP 00000000, RSI 00000000, RDI 00000000.
- Modules:** Shows the loaded path `/usr/bin/yes` and `/lib64/libc.so.6`.
- Hex View-1:** Shows memory addresses `00007FFE996F62D8` and `000055A3A4102D5E` with their corresponding hex values.
- Output:** Shows the IDAPython 64-bit v7.4.0 final (serial 0) (c) The IDAPython Team <idapython@googlegroups.com> message, indicating that the `gnulnx_x64` library is loaded and types are applied to 0 names.

5. Remote debugging

In case of remote debugging you can run IDA and PIN backend on different platforms.

5.1. Starting the remote PIN backend

The first thing to do, is to start the PIN debugging backend on the target machine. Command line depends of bitness of the target application.

```
$ <path-to-pin> -t <path-to-pintool> -p <port> -- <application> <application-options>
```

For example, a 64-bit application `ls` would be started for debugging by the following comand:

```
$ /usr/local/pin/pin \
-t /usr/local/pin/source/tools/idapin/obj-intel64/idadbg64.so \
-p 23947 -- \
/bin/ls
```

whereas a 32-bit one `hello32` as follows:

```
/usr/local/pin/pin \
-t /usr/local/pin/source/tools/idapin/obj-ia32/idadbg.so \
-p 23947 -- \
./hello32
```

there is a more complicated way to start an application regardless bitness:

```

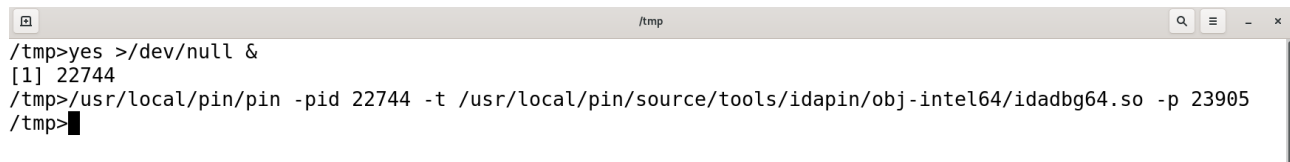

/usr/local/pin/pin \
-t64 /usr/local/pin/source/tools/idapin/obj-intel64/idadbg64.so \
-t /usr/local/pin/source/tools/idapin/obj-ia32/idadbg.so \
-p 23947 -- \
/usr/bin/ls

```

Also you can attach to already running programs:

```
$ <path-to-pin> -pid <pid-to-attach> -t <path-to-pintool> -p <port> --
```

For example:

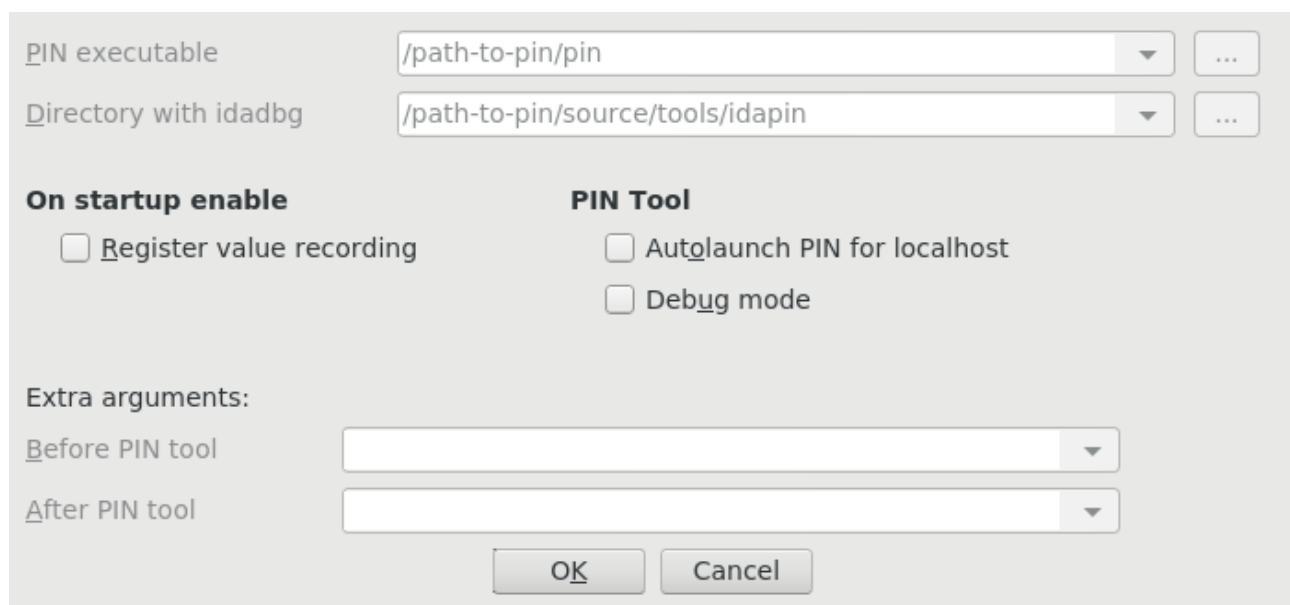

```

/tmp>yes >/dev/null &
[1] 22744
/tmp>/usr/local/pin/pin -pid 22744 -t /usr/local/pin/source/tools/idapin/obj-intel64/idadbg64.so -p 23905
/tmp>

```

5.2. Connecting IDA to the backend

The next step is to select PIN tracer module in IDA via **Debugger > Select debugger** and switch IDA to remote PIN backend. For this you should disable option **Autolaunch PIN for localhost** in the PIN options dialod (**Debugger > Debugger options > Set specific options**):

PIN executable: /path-to-pin/pin

Directory with idadbg: /path-to-pin/source/tools/idapin

On startup enable

Register value recording

PIN Tool

Autolaunch PIN for localhost

Debug mode

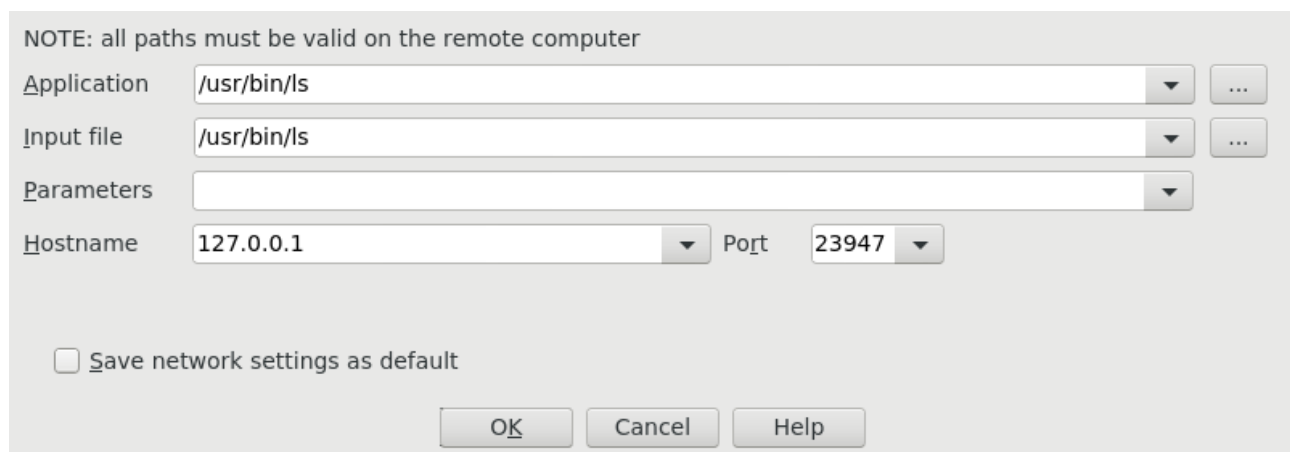

Extra arguments:

Before PIN tool: []

After PIN tool: []

OK Cancel

and then tell IDA about the backend endpoint, through the menu action **Debugger > Process options...**

NOTE: all paths must be valid on the remote computer

Application: /usr/bin/ls

Input file: /usr/bin/ls

Parameters: []

Hostname: 127.0.0.1 Port: 23947

Save network settings as default

OK Cancel Help

Once IDA knows what host to contact (and on what port), debugging an application remotely behaves exactly the same way as if you were debugging it locally.
